

Industry's First 3-Stream 802.11n Competitive Testing

October, 2012

Starting at the End (Key Findings)

1. Independent testing performed by Syracuse University at Syracuse University (Ruckus did not pay for testing)
2. Ruckus worked with SU on test bed but **not** allowed to influence actual testing
3. Wide variations between vendor claims and actual performance of 3-stream 802.11n APs (surprise, surprise)
4. At distance and as environment becomes difficult (e.g. more clients, interference), AP performance degrades
5. Ruckus doesn't win all tests but delivers overall **best** TCP performance and client capacity

Test Overview

- **Goal:** Determine real-world 3-stream AP performance via independent testing at Syracuse
- Industry's first competitive testing of three-stream capable 802.11n enterprise APs

- Three tests performed:
 1. Single AP, single client
 2. Single AP, multiple clients
 3. Multiple APs multiple clients

Overall Vendor Performances

Industry's First 3x3:3 802.11n Competitive Testing

Percentage of Vendor Test Wins

Test Methodology

What is it?

- Testing in an environment that closely resembles *actual* customer deployment and environment
- Focus on most deployments are capacity-based, not coverage

Why do it?

- One client/one AP does not guarantee a successful, multi-client deployment
- Vendor claims \neq actual throughput

Goals

- Show real, meaningful, achievable performance

Cross-Test Constants

- Very clean RF environment (tests performed at night)
- 3-stream MacBook Pros and NETGEAR USBs dongles
- IxChariot: Throughput.scr
 - 1MB file transfer for 2 minutes
 - High Performance Throughput script for single AP tests
 - 10MB file transfer for 2 minutes
- 20MHz channel width for 2.4GHz, 40MHz for 5GHz
- AP channel selection
 - Single AP: ch. 1 (2.4 GHz), ch 36 (5 GHz)
 - Multi AP: automated channel selection, then set manually
- “Winner” determined by aggregate TCP throughput

Hinds Hall

Wi-Fi Test Overview

1. Single AP, single client per radio at various distances

- 2.4 GHz, 5 GHz, 2.4 GHz *and* 5 GHz
- 135 tests for each AP (5 locations, “3” bands, 3 orientation, up/down/bi)

2. Single AP, multiple clients

- One AP, three rooms, 30 clients/room
- Rooms are different distances away from AP
- 2.4 GHz, 5 GHz, 2.4 GHz *and* 5 GHz

3. Multi-AP, multi-client

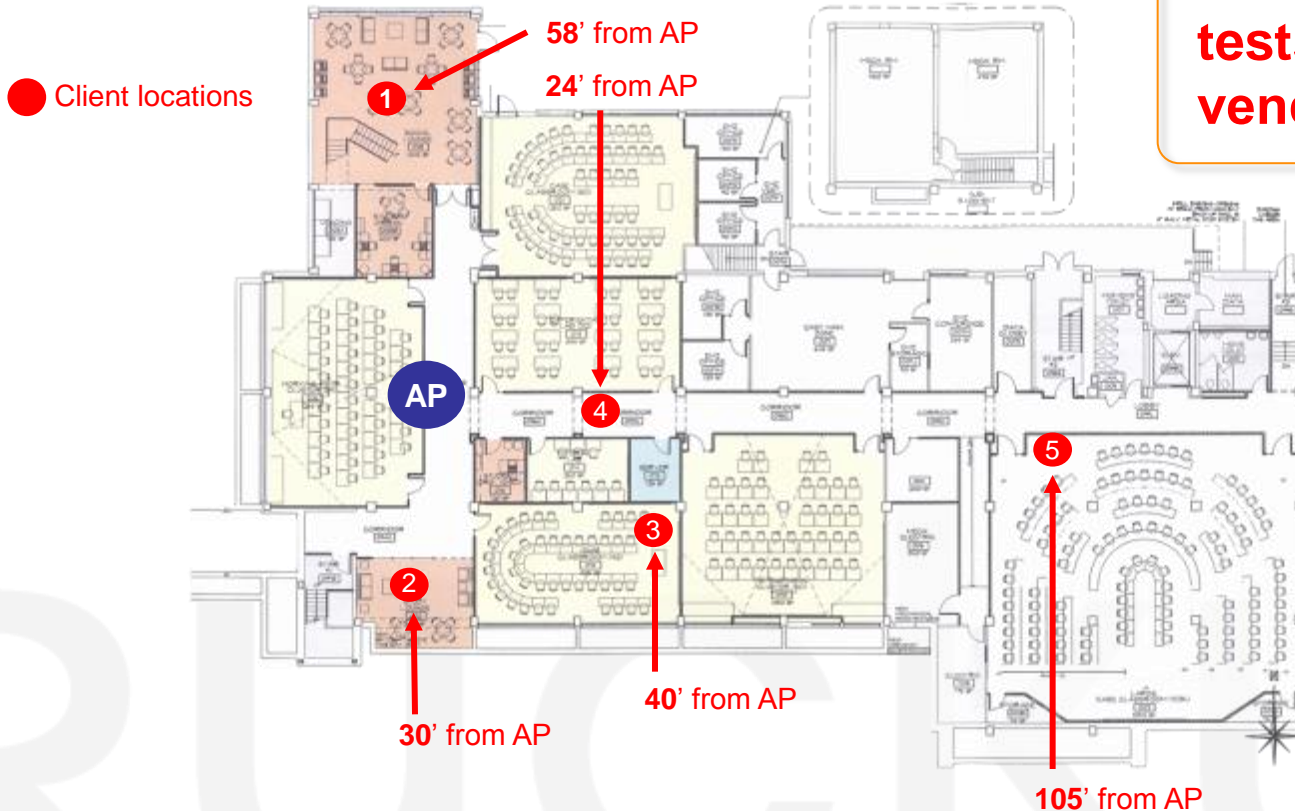

- 1 - 4 rooms of 30 clients (120 clients)
- Channel selection, client load balancing, band steering all enabled
- Tests with and without an interfering Wi-Fi neighbor network

Test 1: Single AP Single Client

- 5 locations of varied distances and difficulties
- 2.4 GHz, 5GHz, simultaneous
- Up/down/bi-directional
- 3 orientations

**= 135 (5 * 3 * 3 * 3)
tests for each
vendor's AP**

LONG DISTANCE

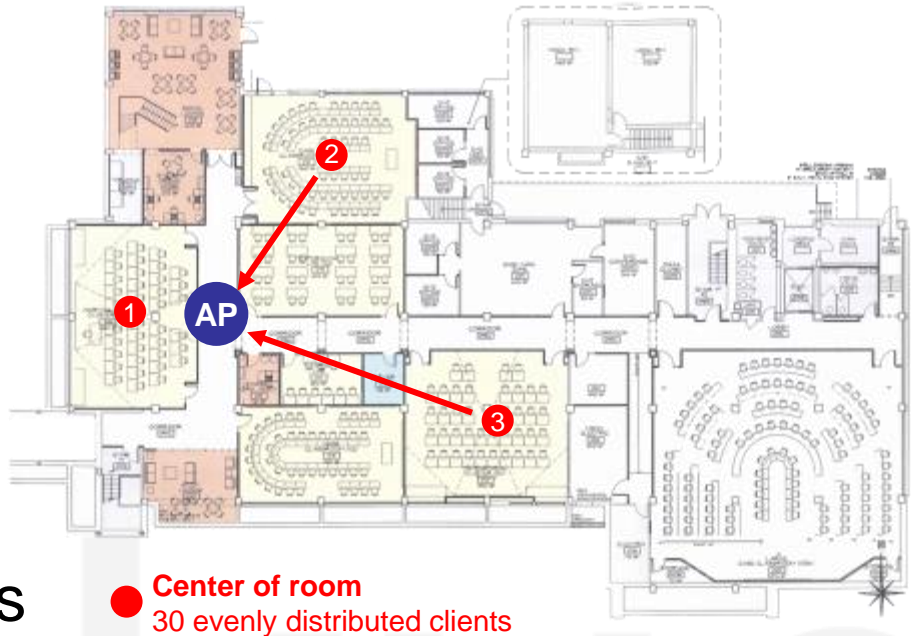

Test 2: Single AP, Multi-Client

- One AP, three rooms, 30 clients/room
- Mixed bands ($\frac{1}{3}$ on 2.4 GHz | $\frac{2}{3}$ on 5 GHz) + bi-directionality
- All clients associated, even if not being tested

1. Room 1: 20' from AP
 - 30 PCs with dongles
2. Room 2: 45' from AP
 - 30 MacBook Pros
3. Room 3: 55' from AP
 - 30 PCs with dongles
4. All rooms, 90 clients across all 3 rooms simultaneously

Single AP, Multi-Client, Room 1

BI-DIRECTIONAL
TCP THROUGHPUT
1 AP, 1 ROOM, 30 CLIENTS
SHORT DISTANCE

Single AP, Multi-Client, Room 2

BI-DIRECTIONAL
TCP THROUGHPUT
1 AP, 1 ROOM, 30 CLIENTS
MEDIUM DISTANCE

Single AP, Multi-Client, Room 3

BI-DIRECTIONAL
TCP THROUGHPUT
1 AP, 1 ROOM, 30 CLIENTS
LONG DISTANCE

High Density TCP Performance

BI-DIRECTIONAL
TCP THROUGHPUT
1 AP, 3 ROOMS, 90 CLIENTS
ALL DISTANCES

Test 3: Multiple APs, Multiple Clients

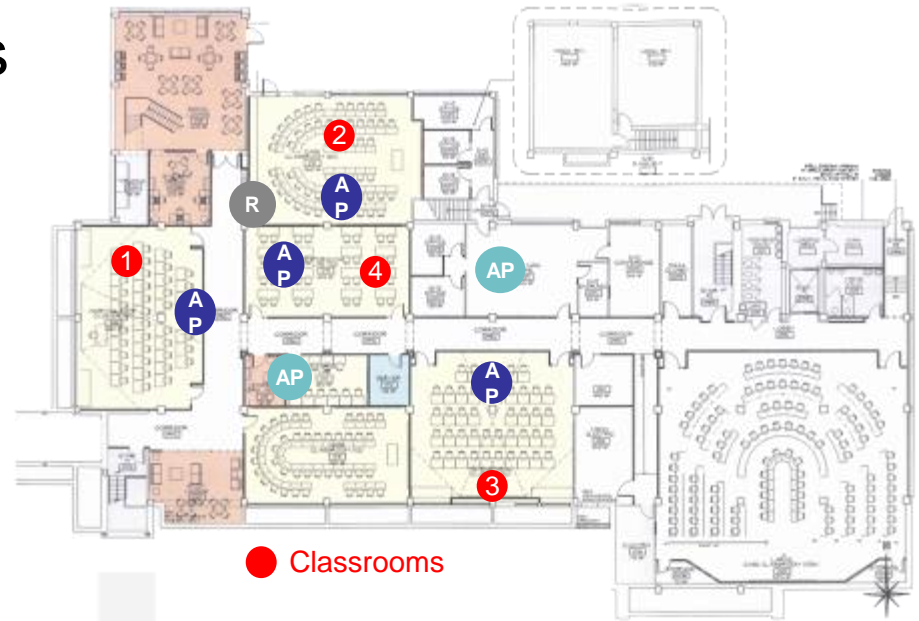

- 6 APs, 4 rooms
- Each classrooms has an AP, 30 clients (120 clients total)
 - Clients: $\frac{1}{3}$ on 2.4 GHz, $\frac{2}{3}$ on 5 GHz
- 2 other APs in nearby rooms

- Features turned on:

- Auto channel selection
- Client load balancing
- Airtime fairness

1. Room 1: 30 PCs w/ Netgear dongles
2. Room 2: 24 MacBooks, 6 Dell laptops
3. Room 3: 30 PCs w/ Netgear dongles
4. Room 4: 30 PCs w/ Linksys dongles

- Test with and without nearby rogue Wi-Fi network (interferer)
 - Two PCs running iPerf for the duration of the testing

Multiple APs, Multiple Clients

BI-DIRECTIONAL
TCP THROUGHPUT
6 APs, 120 CLIENTS
NO NEIGHBOR APS

24 clients uploading
(8 on 2.4 and 16 on 5GHz)
96 clients downloading
(32 on 2.4 and 64 on 5 GHz)

Multiple APs, Multiple Clients

ROGUE AP

Dual-band AP with two 2.4GHz laptops associated client transmitting data back and forth broadcasting on same channel (6) and 5 GHz radio broadcasting with no clients

BI-DIRECTIONAL
TCP THROUGHPUT
6 APs, 120 CLIENTS
WITH NEIGHBOR AP

Summary

- Three-stream 802.11n won't deliver what vendors promise
- Rigorous testing methodology is essential
 - Single AP----client testing doesn't give full picture
 - Multi-AP-----multi client tests reflect more real world
 - Hundreds of tests required to determine the truth
 - Designing repeatable tests is essential
 - Ensuring all SSIDs are the same across vendors
 - Getting PC clients associated
- (Dis)advantages of cloud controller
- The ZF 7982 is a fancy piece of kit
 - Consistently very consistent and high performing
